

Calculation of residual value factor of photovoltaic panels

Overview

The calculation for the LCOE is the net present value of total life cycle costs of the project divided by the quantity of energy produced over the system life. This work was authored in part by the National Renewable Energy Laboratory, operated by Alliance for Sustainable. The cost or residual value remaining in the equipment is the primary funding source if positive or the bulk of the closure costs if negative value. The methods of defining the value are typically not well documented or follow good accounting practices. The following summary of costs related to. As photovoltaic (PV) system prices become less expensive, the salvage value can be increasingly important in life cycle economic calculations.
