

# Communication base station circuit maintenance

## Overview

---

Regular maintenance includes inspection, cleaning, software updates, and hardware replacement. Did you know a single communication base station failure can disrupt services for 5,000+ users?

As global 5G deployments accelerate - with over 7 million base stations projected by 2025 - operators face mounting maintenance challenges. Why do 42% of network outages still stem from preventable. These have caused great pressure on the maintenance of communication base stations. From the proportion of each professional maintenance workload in the total maintenance workload, the maintenance workload caused by the failure of professional power supply equipment accounts for more than 60%. N is a three-digit BCD number (N1N2N3) determined by feeding the channel switch outputs into U600N (for N2 and N3) and N1 control circuit (for N1). U600N requires negative voltage for proper operation.
