

# Distributed photovoltaic support entity

## Overview

---

Those resources specifically located on the distribution system are modeled as retail-scale DERs (e., small combined heat and power and small solar PV power plants), abbreviated as R-DERs and U-DERs. The electric power grid in North America is undergoing a significant transformation in technology, design, control, planning, and operation, and these changes are occurring more rapidly than ever before. Particularly, technological advances in inverter-based resources, inclusive of distributed. Distributed, grid-connected photovoltaic (PV) solar power poses a unique set of benefits and challenges. This brief overviews common technical impacts of PV on electric distribution systems and utility operations (as distinct from other utility concerns such as tariffs, rates, and billing), as well. The Federal Energy Management Program's (FEMP) Distributed Energy and Energy Procurement initiative helps federal agencies accomplish their missions through investment in lasting and reliable energy-generation projects and purchases. Learn about our mission, vision, and impact on the global energy landscape.
