

Dutch all-vanadium liquid flow battery

Overview

Self-contained and incredibly easy to deploy, they use proven vanadium redox flow technology to store energy in an aqueous solution that never degrades, even under continuous maximum power and depth of discharge cycling. Our technology is non-flammable, and requires little. Vanadium redox flow batteries (VRFBs) have emerged as a promising contenders in the field of electrochemical energy storage primarily due to their excellent energy storage capacity, scalability, and power density. The battery uses vanadium ions, derived from vanadium pentoxide (V_2O_5), in four different oxidation states. These vanadium ions are dissolved in separate tanks and pumped through a central chamber where they exchange electrons, generating electricity. Lithium-ion batteries power your phone and dominate the EV market, but here's the kicker: they're kind of.
