

Grid-side distributed energy storage

Overview

Distributed Energy Storage (DES) refers to smaller-scale energy storage units deployed throughout the electrical grid, rather than concentrated at a single, large facility. DES units are typically located on the distribution side of the grid or behind the meter at a customer's. Energy from fossil or nuclear power plants and renewable sources is stored for use by customers. DERs can improve energy reliability and resilience by decentralizing the grid. Massive opportunity across every level of the market, from residential to utility, especially for long duration. Battery energy storage systems (BESS) store energy. When energy generation exceeds demand, energy storage systems can store that excess energy until electricity production drops and the energy can be deposited back to the power grid.
