## Overview

---

To determine how many ground piles are needed for installing 1 million solar panels, several variables must be considered: 1. The design of the solar installation. In solar farm construction, the selection of the appropriate pile type is crucial for ensuring the stability and longevity of the infrastructure. Its high strength-to-weight ratio makes it ideal for bearing. Common types include driven piles, helical piles (or screw piles), and ballasted anchors. They are only 10-15% costlier than traditional rooftop panels but offer an efficiency of about 20-25% more than those. These are small, mounted on a single pile of concrete or steel, and usually. The selected solar panel is known as Top-of-Pole Mount (TPM), where it is designed to install quickly and provide a secure mounting structure for PV modules on a single pole.
