

# How to connect the fuse wire to the ground of photovoltaic panels

## Overview

---

MC4 inline fuses are designed to be plug-and-play with MC4 connectors. Then, insert the MC4 inline fuse assembly by plugging it directly between the panel's positive MC4 connector. To properly fuse a solar system, you must install DC-rated fuses sized at 156% of the array's short-circuit current ( $I_{sc} \times 1.56$ ) in the positive conductors of parallel-connected strings, following NEC Article 690 requirements for overcurrent protection. This protects against dangerous electrical. For solar panels connected in parallel within a string, the correct fuse size is calculated by multiplying the nameplate  $I_{sc}$  of each individual module by 1. This step eliminates the risk of live current flow, creating a safe working environment. Get your setup right for reliable power! Follow us @Bustinout skoolie #bustinoutskoolie. If your panels are smaller than 50 watts, and use only 12 gauge wires, and 20 amp fuses are required.
