

# How to reduce load in microgrid

## Overview

---

This article explores a DSM strategy combining load shifting (shifting demand to periods of high PV generation), peak clipping (limiting maximum load), and valley filling (redistributing load during low-demand periods). The microgrid control system needs to continuously evaluate and prioritize loads in order to maintain this balance. We examine methodologies for measuring, evaluating prioritizing and controlling loads under all conditions to maximize the performance of the microgrid. Strategies are presented for. This is part one of our “How to Manage Microgrids” series which will detail strategies for efficiently managing microgrids with load shifting techniques in grid-tied systems. Through this series of articles, we will explore different use cases for behind-the-meter projects ie. A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid.

## How to reduce load in microgrid

---

- LiFePO<sub>4</sub>
- Wide temp: -20°C to 55°C
- Easy to expand
- Floor mount&wall mount
- Intelligent BMS
- Cycle Life:≥6000
- Warranty :10 years

### Microgrid Load Management and Control Strategies

Abstract- Load control and management is a key component of a microgrid. It is essential at all times to maintain the balance of generation vs. load. The microgrid control system needs to continuously ...
