

## Overview

---

The energy storage challenge in photovoltaics is characterized by three major factors: inefficiency in storage systems, variability in energy production, and high associated costs. Storage is a solved problem. In 2023, twice as much solar generation capacity was installed as all other generation technologies combined. The future of energy generation is solar photovoltaics with support from wind energy, and energy storage to balance the intermittency of wind and solar. Inefficiency in storage systems – Current energy storage. These variations are attributable to changes in the amount of sunlight that shines onto photovoltaic (PV) panels or concentrating solar-thermal power (CSP) systems. Solar energy production can be affected by season, time of day, clouds, dust, haze, or obstructions like shadows, rain, snow, and. MITEI's three-year Future of Energy Storage study explored the role that energy storage can play in fighting climate change and in the global adoption of clean energy grids.
