

# Microgrid operation balance constraints

## Overview

---

To tackle this challenge, we propose an multi-objective optimization algorithm with multi-stage constraint-handling strategy to handle the high-dimensional complex constraints of the resilient energy management problem. This paper reviews the developments in the operation optimization of microgrids. We first summarize the system structure and provide a typical system structure, which includes an energy generation system, an energy distribution system, an energy storage system and energy end users. Then, we. Microgrid energy management system (EMS)/power management system (PMS) optimisation problems often have conflicting objectives subjected to nonlinear constraints. They are challenging to solve due to sources of discontinuity and non-convexity. In addition to using such reserve to limit.
