

Motianling Wind Power Generation

Overview

Wind turbines work on a simple principle: instead of using electricity to make wind—like a fan—wind turbines use wind to make electricity. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. As of 2018 the largest wind farm in the world was the Jiuquan Wind Power Base, an array of more than 7,000 wind turbines in China's Gansu province that produces more than 6,000 megawatts of power. But how does a seemingly simple breeze transform into energy that powers our homes, businesses, and industries?

This article will explain the process in. Wind energy is a renewable source of electrical or mechanical power that could help transform the energy sector. The challenge of emitting less and less CO₂ in order to limit global warming calls for the design of a low-carbon electricity mix in which hydraulic, nuclear, hydrogen, solar, wind and other renewable energies are combined.
