

Photovoltaic drainage board temperature measurement device

Overview

It uses high-precision thermistors as sensing elements, capable of accurately measuring the temperature variations on the surface or inside of solar panels and converting this data into voltage or current signals for monitoring and control purposes. Accurate measurement of PV irradiance, temperature, and module tilt for precise data collection. Wireless connectivity with 100 m range for flexible and efficient solar testing. Choose up to three Irradiance Sensors and three Back-of-Panel Temperature Sensors along with three standard sensor options and an optional Ultra Sonic Anemometer.
