## Overview

---

While solar panels pose minimal danger when handled correctly, they are not a failsafe energy solution. Solar energy is derived from the sun's rays and is harnessed through solar panels. These panels convert sunlight into electricity through the process that turns sunlight into electricity, which excites electrons within photovoltaic cells made of silicon materials. Just one of scores of health impacts can be increased cancer risk. EMF stands for manmade "electromagnetic field (s)", such as produce unnatural electric, magnetic, or rf (microwave). The increasing use of solar photovoltaic (PV) systems has led to public questions about their safety. Because PV systems do not burn fossil fuels they do not produce the toxic air or greenhouse gas emissions associated with conventional fossil fuel fired generation technologies. Department. While the environmental benefits are understood, the health and safety risks these systems present, particularly during installation, operation and maintenance, are considerable and need to be managed properly.
