

Photovoltaic panels do not require brackets

Overview

The solar panels cannot maintain steady performance and stay safe without brackets. Being a homeowner, contractor, or business owner looking into solar, you need proper bracket selection to make your setup successful. With the exception of raised-seam metal roofs, most roof types require penetrations for rack mounts. In the best installations, standoffs, lag screws, or bolts tie into structural members. All brackets should have butyl tape or a high-quality caulking such as polyurethane or polysulfide, to seal. Rail-less mounting systems, however, skip this step by directly attaching solar panels to the roof using specialized mounts and brackets, eliminating the need for long metal rails. Rail-less mounting generally requires fewer materials and can streamline the installation process, making it. Modern solar mounting systems consist of roof attachments (with or without flashing), mounting rails, and module clamps.
