

# Sea-based new energy storage model

## Overview

---

Germany's Fraunhofer Institute has unveiled an innovative solution that taps into the power of the deep sea to store electricity – the StEnSea (Stored Energy in the Sea) project. This cutting-edge technology could transform the way we balance energy grids and manage renewable power. Sizable has tested a small model of the reservoirs in wave tanks and off the coast of Reggio Calabria, Italy. It's now deploying a pilot of the floating components in advance of a full demonstration plant. At full. The Stored Energy in the Sea (StEnSEA) project represents a novel pumped storage concept aiming to facilitate large-scale storage of electrical energy that's cost-competitive with existing solutions. This is where a new innovation dives in—literally. Introducing the Ocean Battery—a groundbreaking energy storage system engineered to operate beneath the seabed, offering a sustainable solution for. Rigorous tests confirm offshore pumped hydro system can operate reliably in harsh ocean environments ahead of pilot in the Mediterranean Sea Sizable Energy successfully confirmed that its ocean energy storage system can operate reliably in harsh ocean environments in the wave basin at the Maritime. If Germany's Fraunhofer Institute for Energy Economics and Energy System Technology (IEE) has its way, it could soon turn the ocean floor into a giant battery — one concrete sphere at a time.
