

Solar power generation uses photoelectric tubes

Overview

Photovoltaic solar energy is a clean, renewable source of energy that uses solar radiation to produce electricity. It is based on the so-called photoelectric effect, by which certain materials are able to absorb photons (light particles) and release electrons, generating an. Devices based on the photoelectric effect have several desirable properties, including producing a current that is directly proportional to light intensity and a very fast response time. One basic device is the photoelectric cell, or photodiode. Tower power plants have a central receiver located on a tall column surrounded by mirrors called heliostats. Below, you can find resources and information on the. Solar PV systems generate electricity by absorbing sunlight and using that light energy to create an electrical current.
