

# There is output voltage on one side of the inverter

## Overview

---

This is caused by low intermediate circuit DC voltage. This can be caused by a missing supply voltage phase from a blown fuse or faulty isolator or contactor or internal rectifier bridge fault or simply low mains voltage. **POSSIBLE FIXES:** Check mains supply and fuses. The inverter has no U, V, W phase voltage output, but there is normal voltage between P and N of the main circuit (both ends of the energy storage capacitor), the high voltage indicator light is on, the inverter has entered "normal working status", and the mainboard MCU has also made a Based on. Before going to the array location, check and record the inverter's input and output voltage and current with a True RMS multimeter. **POSSIBLE FIXES:** Turn the overvoltage controller is. They work by converting the power obtained from the DC source, which is the input source of the inverter, into AC, which is the output source of the inverter, and then distributing it to various devices that require AC sources. In this blog post, we will guide you on how to diagnose and potentially fix these problems.
