

Topology of three-phase cascaded H-bridge energy storage system

Overview

A three-phase cascaded H-bridge multilevel inverter topology for a grid-connected PV system is presented in this paper. The panel mismatch issues are addressed to show the necessity of individual MPPT control, and a control scheme with independent MPPT control in each string is then. When connecting a renewable energy source to a medium-voltage grid, it has to fulfil grid codes and be able to work in a medium-voltage range (>10 kV). Multilevel converters (MLCs) are recognized for their low total harmonic distortion (THD) and ability to work at high voltage compared to other. Therefore, a large number of Battery Energy Storage Systems (BESS) are connected to the power grid, mainly used to improve the grid's frequency regulation and voltage regulation capabilities. The power limitation of single-phase inverters is bypassed using the three-phase B6-bridge inverters.
