

# Which part of the green base station technology is the most difficult

## Overview

---

As we move from 4G to 5G to 6G, there's a lot of talk about making “green” base stations that consume less power. Toward this end, the R&D center has developed a test system aimed at increasing base-station backup time during power outages and contributing to power conservation and protection of the environment through effective use of ecological power generation devices. Recognizing this, Mobile Network Operators are actively prioritizing EE for both network maintenance and environmental stewardship in future cellular networks. As a result, an estimated 640,000 base stations around the world are off-grid. Diesel. Electronics devices are designed to consume less power because generating electricity depletes finite energy sources and can pollute the atmosphere with greenhouse gases.
